This public briefing was prepared for the European Environment Agency (EEA) by its European Topic Centre on Climate Change Mitigation (ETC CM). The EEA would like to thank the ETC CM partner Öko-Institut for this publication. In particular, the EEA would like to acknowledge the contributions from Sylvie Ludig, Wolfram Jörß and Victoria Liste. The EEA would also like to thank the European Commission Directorate General for Climate Action and Suzanne Dael (EEA) for their valuable comments provided.

The EEA briefing coordinator was Peder Gabrielsen and the ETC CM task manager was Sylvie Ludig.

Briefing

Introduction

Fluorinated greenhouse gases (F-gases) contribute to climate change; in 2022, they made up 2 % of total greenhouse gas emissions in the EU-27 (EEA, 2024a). F-gases have a range of applications, particularly in the refrigeration, air conditioning and heat pump sector. Most F-gases have much higher global warming potentials than other greenhouse gases. Even small amounts of F-gases negatively impact our climate; thus, it is important to reduce and eventually replace their use. This briefing outlines the important trends in the EU supply¹ of F-gases for the period 2007-2023 and provides an overview of EU's progress under the HFC (hydrofluorocarbons) phase-down schemes of the EU F-gas Regulation and the Montreal Protocol.

Key messages

- The EU remains on track under the HFC phase-down of the EU F-gas Regulation. With a 2 % decrease in 2023 compared to 2022, the EU-wide placing on the market of HFCs in 2023 was 5% below the maximum quantity allowed to be placed on the EU market by the F-gas Regulation.
- The total supply of F-gases to the EU in 2023, measured in CO₂ equivalents, was 10 % lower than in 2022. 2023 F-gases supply is at roughly the same level as observed in 2021 and about 45 % below 2015. The HFC phase-down resulting in a decrease of HFC supply is the key driver for the decrease in F-gases supply since 2015. The 10 % decrease compared to 2022 was due to reductions for both HFCs and SF₆. SF₆ supply has been fluctuating at +/- 40 % since 2015. However, a clear medium-term trend for SF₆ supply is not visible.
- Refrigeration, air conditioning and heat pumps (RACHP) continue to be key applications for these gases, in particular for HFCs which contribute about 70 % to 2023 EU F-gases supply, measured in CO₂ equivalents. SF₆ is mainly used in electrical equipment and makes up about 20 % of 2023 EU F-gases supply.
- After a steady decrease of HFC imports in RACHP from 2016 to 2020, imports of HFCs in RACHP equipment increased by about 50 % (in tonnes of gas) between 2020 and 2022. In 2023, there was a decrease of 13 % compared to 2022, with imports back at 2021 levels again. The primary factor contributing to the decrease in 2023 as compared to 2022 are overall reduced imports of stationary cooling and heating equipment, as well as heat pumps².
- Like in 2021 and 2022, the use of quota authorisations needed in 2023 to cover imports of RACHP equipment under the HFC phase-down exceeded the amount of quota authorisations newly issued in 2023. Compared to 2020, the amount of unused quota authorisations banked by equipment importers has decreased by 24 %. However, the current size of the quota reserve still accounts for more than four times the amount of such equipment imported in 2023.
- Under the Kigali Amendment to the Montreal Protocol, the EU is subject to an international HFC phase-down. In 2023, EU consumption of HFCs was at 43 % of the maximum imposed by the Montreal Protocol.

Hydrofluorocarbons (HFCs) account for the majority of fluorinated gas (F-gas) emissions. To reduce these, the F-gas Regulation (EU) No 517/2014 introduced an EU HFC phase-down scheme and a quota system for

¹ Supply of fluorinated gases is a metric used by the EEA that provides information on the actual use of fluorinated gases by EU industries. It is calculated primarily from reported production, imports and exports. For methodological details on the calculation of EU supply, please refer to Table 30 in section 10 of the Annex to this briefing, which explains the difference between the metrics of 'EU supply', 'placing on the market', and 'consumption', which are relevant for different aspects of the legal framework.

² Please note that the data reported by companies used in this report only contains information on imports of RACHP equipment containing HFCs. The data cannot be used to assess imports of RACHP equipment containing other, non-fluorinated refrigerants

companies. It was revised in 2024 and the new F-Gas Regulation (EU) No 2024/573 started to apply on 11 March 2024. Since 2019, the EU has also been bound by an obligation to reduce HFC use, agreed internationally under the Kigali Amendment to the Montreal Protocol.

Please consult the annex to this briefing for more graphs and data tables.

Policy context

The Montreal Protocol was established in 1987 to cut the consumption and production of synthetic substances that destroy the protective ozone layer (ozone-depleting substances, ODS). In the EU, ODS are regulated separately under the Regulation (EU) No 2024/590 (Ozone Regulation). Phasing out ODS has led to replacement of the regulated ODS in some cases with the increased use of certain F-gases, most prominently in refrigeration and air conditioning, since the early 1990s, as these chemicals have similar properties to ODS but do not affect the ozone layer. Consequently, emissions of F-gases in the EU, of which about 90 % are HFCs, increased by about 70 % between 1990 and 2014.

Because F-gases are potent greenhouse gases, the rapid increase in their use posed a climate threat that was subsequently addressed by the Kigali Amendment to the Montreal Protocol. They have been regulated in the EU since 2006. Total emissions have started to decline since peaking in 2014 and were about 33 % lower in 2021 in the EU-27 compared with 2014 (EEA, 2024a).

The 2014 revision of the EU F-gas Regulation (EU, 2014) implemented an EU-wide phase-down of HFCs, which started in 2015. Its aim was to cut EU emissions of F-gases by two thirds by 2030 compared with 2014 levels. It mandated companies to report their annual production, imports, exports and other activities involving HFCs and other F-gases and includes all the F-gases covered by the Kyoto Protocol: HFCs, perfluorocarbons (PFCs), sulphur hexafluoride (SF₆) and nitrogen trifluoride (NF₃) and others such as unsaturated HFCs and HCFCs (hydrochlorofluorocarbons), often referred to as HFOs (hydrofluoroolefins). The European Commission proposed a revision of the 2014 F-gas Regulation in April 2022 and following interinstitutional negotiations, the European Parliament and the Council adopted F-gas Regulation (EU) 2024/573 (EU, 2024) in February 2024. The new Regulation started to apply on 11 March 2024. The revised quota system establishes a steeper reduction of amounts that importers and producers may place on the EU market and includes a phase-out of HFCs by 2050. It is important to note, however, that data collected for this report was still subject to the previous F-Gas Regulation (EU) No 517/2014.

The EU's key climate objective is to achieve climate neutrality by 2050, with a net greenhouse gas emission reduction target of 55 % by 2030 compared with 1990. This has already been adopted as the European Climate Law. Reducing F-gas emissions contributes to reaching these objectives.

Key trends for HFCs

Development related to the EU use of HFCs is measured in three different metrics:

- 1) **supply**, focusing on the physical use of HFCs by EU industries,
- 2) **placing on the EU market (POM)** measuring compliance with the EU HFC phase-down, and
- 3) **consumption** as defined under the Montreal Protocol HFC phase-down.

Due to differing definitions how imports, exports, stocks, destruction, exemptions etc. are accounted for, these metrics (all expressed in units of CO₂ equivalents) can deviate more than 20 % for a given year. Please see Table 30 in the annex for detailed definitions.

Figure B-1 shows the EU HFC trends in the supply (yellow), POM (blue) and consumption (grey) metrics as well as the respective EU-internal and MP HFC phase-down limits and schedules.

Figure B-1 EU HFC supply and progress of the HFC phase-downs under the EU F-gas Regulation and the Montreal Protocol

Notes: The geographical scope of the data presented (both reported data and phase-down limits) is EU-28 except Croatia for 2007-2008, EU-28 for 2009-2019, EU-27 + UK for 2020 and EU-27 for 2021 and subsequent years. Due to differing definitions, POM data (blue) as defined under the EU F-gas Regulation are not directly comparable with consumption data (grey) as defined under the Montreal protocol.

Sources: EC, 2024; EEA, 2023a and 2024b.

EU HFC supply in 2023 was about 10 % below 2022 levels. Meanwhile, EU quota-relevant POM of HFCs as accounted under the EU F-Gas Regulation decreased by 2 % compared to 2022, and remained 5 % below the limit for 2023. EU-27 HFC consumption as accounted under the Montreal Protocol decreased by about 4 % compared to 2022 and was in 2023 57 % below the limit set for the EU under the MP.

More detailed information on the progress under the EU and MP reduction schemes as well as on supply of HFCs and other F-gases is given in the subsequent sections.

Phase-down of HFCs under the EU F-gas Regulation

The HFC phase-down under the F-gas Regulation is implemented by imposing annual quantitative limits (quotas) on the placing of HFCs on the EU market by producers and importers. The EU-wide maximum quantity for HFCs has been subject to a stepwise reduction since 2015, shown as blue lines in Figure B-1. In 2023, EU-wide placing of HFCs on the market was 5 % below the 2023 overall market limit set by the quota system. The companies that did not fully use their quota counterbalanced the few cases of quota exceedance by importers of bulk HFCs and equipment importers.

As EU industries have been moving to alternatives with low global warming potential (GWP), the demand for HFCs has been decreasing. While the demand for refrigerants remains high, there has been a shift to non-HFC alternatives with lower GWPs. Between 2015 and 2023, the placing on the market of bulk HFCs

(dark blue bars in Figure B-1) was continuously below the maximum quantity imposed by the phase-down. The balance has largely been converted into quota authorisations (light blue bars in Figure B-1), which can be stored over the years and which have been needed by importers of refrigeration, air conditioning and heat pump (RACHP) equipment containing HFCs since 2017.

Note that the supply of HFCs for the manufacture of metered dose inhalers (MDIs) has been quota-exempted since 2018 and the respective amounts of approximately 10 Mt CO₂e per year are not included in the dark blue bars since then. Under the 2024 revision of the F-gas Regulation, the quota exemption for MDI supplies will be lifted starting 2025. This explains also why the 2025 maximum quantity for HFCs under the EU phase-out is higher than for 2024.

Until 2020, the supply of quota authorisations has exceeded quota-relevant RACHP equipment imports, and as a consequence, the 'bank' of unused quota authorisations, held by equipment importers, continued to grow. In 2021, the use of quota authorisations exceeded the amount of freshly issued quota authorisations for the first time. In 2022 and 2023, this trend continued with the amount of quota authorisations issued being at about 60 % and 80 % of authorisation use, respectively. By the end of 2023, this led to a decrease in the bank of quota authorisations by 4 % compared to 2022, or by 24 % compared to 2020. However, the reserve of unused quota authorisations available by the end of 2023 was still at more than four times the amount needed total volume of EU equipment imports in 2023. Nonetheless, the continuing decrease of the authorisation bank indicates that the reduction of available quota under the EU phase-down has lately been quicker than the industry's response in demand reduction.

Illegal HFC imports outside the reporting and compliance system under the F-gas Regulation continue to be alleged, and as in previous EEA reports these cannot be quantitatively accounted for in this briefing.

After significant increases in the number of companies applying for quota until 2019, the European Commission's increased scrutiny of their legitimacy has reduced the viability of mass registrations (EU, 2019). Therefore, the number of quota-holding companies has declined significantly between 2019 and 2020. As a consequence, the number of companies reporting on bulk HFC imports and quota authorisations decreased between 2020 and 2022 and reached more or less 2018 levels again after more than doubling in 2019. In 2023, there was an increase in companies reporting on bulk HFC imports of 14 % compared with 2022, but levels remain well below those of 2019 and 2020. Around 970 companies reported on bulk HFC imports in 2023, while the number of companies reporting on RACHP imports was 1055. The number of companies reporting on RACHP imports has been at around 1000 since 2017.

More graphs and data tables relating to compliance with the EU HFC phase-down are provided in the annex to this briefing.

EU contribution to the global phase-down of HFCs under the Kigali Amendment to the Montreal Protocol

The global HFC phase-down under the Montreal Protocol's Kigali Amendment introduced limits for the EU consumption of HFCs, starting in 2019 (grey lines in Figure B-1). 2023 HFC consumption (grey bars in Figure B-1) in the EU-27 was 4 % below 2022 values. EU HFC consumption was thus at approximately 43 % of the 2023 limit for the EU-27 under the Montreal Protocol's Kigali Amendment.

As visualised in Figure B-1, the ratio between HFC consumption (grey bars) and the quota limit under the EU F-gas Regulation (blue bars) has been strongly fluctuating over many years. The most important differences between definitions of consumption and POM in this context are the accounting of the quota exemption for MDIs and of HFCs in imports of precharged equipment. Furthermore, variations in end-of-year stocks of HFCs not yet placed on the market can play a role.

More graphs and data tables relating to the EU HFC phase-down under the Kigali Amendment to the Montreal Protocol are provided in the annex to this briefing.

Supply of F-gases in the EU

The total supply of F-gases⁽³⁾ was reasonably stable from 2007 until it peaked in 2014, just before the HFC quota system entered into force. After 2015, a downwards trend reflected the effect of the EU HFC phase-down under the F-gas Regulation. While the years 2018 and 2019 show a sharp decrease, the trend was less pronounced in 2020 to 2022 with smaller subsequent decreases and increases. The volume of EU total F-gases supply (i.e. both HFCs and other F-gases) in physical tonnes in 2023 was about 4 % lower than supply in the previous year (Figure B-2), with an about 10 % lower GWP in 2023 than in 2022 (Figure B-3). Refrigeration and air conditioning (including heat pumps) continue to be key applications. An important detail is that statistics in physical tonnes reflect the use patterns of F-gases in EU industries (Figure B-2), while the amount of F-gases expressed in carbon dioxide equivalents (CO₂e) reflects their potential relevance for climate change policy and the HFC phase-down (Figure B-3).

Key drivers in 2023 for the decrease in F-gases supply compared with 2022 was the supply of HFCs and SF₆, which decreased by 9 % (10 % in CO₂e) and 17 % (17 % in CO₂e) respectively. Production of both HFCs and SF₆ has been decreasing, as well as total imports of HFCs (both bulk and contained in equipment), while imports of SF₆ have increased by 21 % in 2023 compared with 2022. However, in terms of long-term trends, the supply of HFCs is the most relevant driver of the changes in F-gases supply. Supply of SF₆ has been changing over the years but no clear trend is recognizable (Table 15 in the annex to this briefing provides an overview on EU supply for F-gases, including SF₆).

The supply of unsaturated HFCs and HCFCs with very low GWPs, replacing HFCs with significantly higher GWPs, has increased by 16 % and makes up about 26 % of the EU total supply of fluorinated gases in 2023. When comparing the gases with the highest GWPs for the years 2022 and 2023, there was a 17 % decrease for SF₆, and, less relevant for overall F-gas supply in CO₂e, a 11 % increase for NF₃ and a 7 % decrease for PFCs. With a long-term view, supply of NF₃ and other perfluorinated compounds has shown a slow but steady increase while supply of PFCs has been slowly decreasing after 2017.

⁽³⁾ While the previous subsections only discuss HFCs, this section includes trends for EU supply of *all F-gases* covered by F-Gas regulation (EU) 517/2014. The new Regulation (EU) 2024/573 covers a larger range of gases. See Table 26 and Table 27 for more information. Where supply is measured in units of tonnes, the major difference to HFC statistics is due to low-GWP unsaturated H(C)FCs. When measured in CO₂ equivalents, the difference is primarily due to very-high-GWPs gases SF₆, PFCs and NF₃.

Figure B-2 Supply, production, import, export and destruction of F-gases (tonnes)

Notes: The geographical scope of the data presented is EU-27 and the UK (except Croatia) for 2007-2008, EU-27 and the UK for 2009-2020 and EU-27 for 2021 and subsequent years. The scope of F-Gases in the data presented is determined by Regulation (EU) 517/2014. Annex II F-gases (unsaturated HFCs and HCFCs, hydrofluoroethers (HFEs), alcohols and 'other' perfluorinated compounds) and HFCs, PFCs and SF₆ in products and equipment were not subject to reporting for the period 2007-2013. Data presented for import and supply between 2007 and 2013 are thus limited to bulk import and bulk supply. Export is limited to bulk export for the whole time series. Data available for Croatia for the period 2009-2012 are limited to HFCs and do not cover PFCs and SF₆. Starting in 2019, produced amounts include non-captured by-production and destroyed amounts cover destruction of these amounts.

Sources: EC, 2011 and 2014; EEA, 2023a and 2024b.

Figure B-3 Supply, production, import, export and destruction of F-gases (CO₂e)

Notes: The geographical scope of the data presented is EU-27 and the UK (except Croatia) for 2007-2008, EU-27 and the UK for 2009-2020 and EU-27 for 2021 and subsequent years. The scope of F-Gases in the data presented is determined by Regulation (EU) 517/2014. Annex II F-gases (unsaturated HFCs and HCFCs, hydrofluoroethers (HFEs), alcohols and 'other' perfluorinated compounds) and HFCs, PFCs and SF₆ in products and equipment were not subject to reporting for the period 2007-2013. Data presented for import and supply between 2007 and 2013 are thus limited to bulk import and bulk supply. Export is limited to bulk export for the whole time series. Data available for Croatia for the period 2009-2012 are limited to HFCs and do not cover PFCs and SF₆. Starting in 2019, produced amounts include non-captured by-production and destroyed amounts cover destruction of these amounts.

Sources: EC, 2011 and 2014; EEA, 2023a and 2024b.

The trend in F-gas supply in the EU reflects trends in physical flows of F-gases: production, reclamation, imports, exports and destruction in the EU.

- **Production** of F-gases been declining more or less steadily since 2012. In 2023, EU production of F-gases decreased again in production volume (-30 %) compared with 2022. Production of SF₆, which has a very high GWP and was the main driver of the increase in production in 2022, has decreased by 13 % in 2023 compared with 2022 and was 4 % above 2021 levels.
- The quantities (in tonnes) reported as **reclaimed** F-gases increased by about 4 %. While EU HFC reclamation in 2023 increased by 3 %, reclamation of SF₆ increased by 6 % and that of unsaturated HFCs and HCFCs increased by 19 %.
- **Reclaimed** HFCs account for about 13 % of EU production of virgin HFCs in 2023, or less than 2 % of total EU HFC supply (or 6 % and 3 %, respectively, as CO₂e). While 88 % of reclaimed amounts are HFCs, SF₆ contributes to 36 % of the GWP of reclaimed gas.
- Total F-gas **imports** in 2023 increased by 2 % compared with 2022, while there was a decrease of 2 % in CO₂e. The increase measured in tonnes was due to a 25 % rise in imports of unsaturated HFCs and HCFCs by 25 % offsetting a 6 % decline in HFC imports. Since unsaturated HFCs have very low GWPs, the decrease in HFC imports, particularly a 12 % decrease in imports of HFC-134a, led to the decrease in imports in terms of CO₂e, more than offsetting risen imports of high-GWP gases, notably SF₆ (+21 %) and NF₃ (+ 8 %).
- While the increase in total imports was quantitatively mainly driven by bulk imports, there has been a decreasing trend for imports of F-gases contained in products and equipment (roughly 95 %

HFCs, 5 % unsaturated HFCs and HCFCs). Such equipment imports into EU in 2023 were about 11 % lower than in 2022. The main drivers of the decrease in equipment imports are decreasing imports of stationary equipment for cooling and heating as well as heat pumps.

- In 2023, overall **bulk exports** of F-gases from the EU continued their strong decrease since 2017 and decreased by about 14 % compared with 2022; a decrease of about 9 % is visible in CO₂e. Trends are different depending on the gas: while exports in HFCs, PFCs and SF₆ have been decreasing, exports in unsaturated HFCs/HCFCs and NH₃ have been increasing. Due to the strong decrease in HFC exports (-22 %), the overall trend is a decrease. Exports of **F-gases contained in products and equipment** are not subject to obligatory reporting.
- **Destruction** of F-gases is mainly reported for HFCs. After steep increases between 2018 and 2021⁴, the amounts destroyed decreased by about 7 % in 2023. Destruction of non-HFCs also mostly decreased significantly but remains at a low level (about 2 % of gases destroyed in 2023 were non-HFCs). The only difference to this trend is a 9 % increase in destruction of unsaturated HFCs/HCFCs.

More graphs and tables summarising data reported by companies on the production, import, export and destruction of F-gases in the EU, for the period 2007-2023, are contained in the annex to this briefing. The annex also documents the methodology used, in particular for the calculation of the supply, placing on the market and consumption metrics, and institutional arrangements.

⁴ The increase in 2019 had mostly been due to the systematic inclusion of unwanted or off-grade gases destroyed after production before sale in the reporting scope.

Fluorinated greenhouse gases 2024

Data reported by companies on the production, import, export and destruction of fluorinated greenhouse gases in the European Union, 2007-2023

ANNEX

1 Introduction to the Annex

PLEASE NOTE: On 11 March 2024, the new F-Gas Regulation (EU) 2024/573 started to apply. However, the data collection presented in this report, which is based on reports in spring 2024 by companies on their transactions in 2023, was still subject to the old F-Gas Regulation (EU) 517/2014. In the following, mentions of the F-Gas regulation refer to Regulation (EU) 517/2024 unless explicitly stated otherwise.

1.1 Annex structure

This annex includes the following sections:

This introductory Section 1 outlines legal arrangements and their implementation.

Figures

Section 2 contains figures on reporting companies.

Section 3 presents figures on production, imports, exports and destruction of fluorinated greenhouse gases as reported by companies. Section 4 presents key indicators for the EU, based on reported data about the supply of F-gases to the EU market and their intended applications.

Section 5 shows figures on progress under the EU HFC phase-down, while section 6 shows figures on progress under the global HFC phase-down under the Montreal Protocol.

Data Tables

Section 7 provides detailed data tables for the figures presented in sections 2 to 6.

Additional Information

Section 8 briefly explains the terminology used throughout the document, section 9 details the gases covered by the EU F-gas Regulation and thus this document and section 10 outlines the calculation methods used.

1.2 Scope

The data contained in this annex is based on submissions for the year 2023 as received by 6 August 2024 (which includes some late reports and corrections received after the legal deadline on 31 March 2024). Data for previous years were changed slightly after some corrections were submitted.

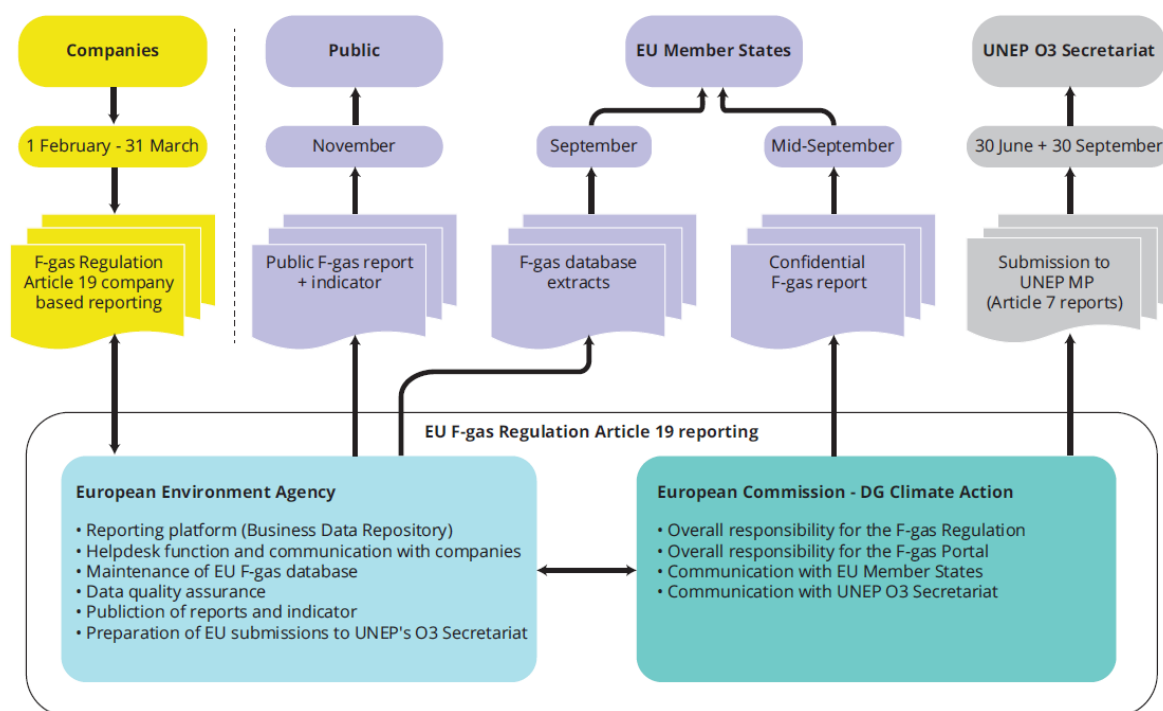

Data for 2007-2013 are covered by the 2006 F-gas regulation, while data for 2014 and onwards are covered by Regulation (EU) 517/2014. Due to the different reporting frameworks, data from the two periods are not always directly comparable. Data collection for this report was still subject to the 2014 regulation. On 11 March 2024, the new F-gas regulation (EU) 2024/573 entered into force. Reporting on 2024 activities will be subject to the new regulation and will F-gas regube reflected in the 2025 update to this report.

The geographical scope for data presented for the years until 2019 is the EU-28. Data for 2020 relates to the EU-27 and the United Kingdom and data for 2021 and subsequent years relates to the EU-27.

1.3 Institutional arrangements

Companies that need to report are obliged to register with the European Commission’s F-gas portal ⁽⁵⁾, which also hosts the HFC registry pursuant to Article 17 of the 2014 F-gas Regulation.

Figure 1-1 Institutional arrangements

Source: EEA, 2023a.

Since 2012, the European Commission has given the responsibility for collecting, archiving and evaluating the data reported by companies to the European Environment Agency (EEA). The reporting process is executed through the EEA’s online platform, the Business Data Repository (BDR), while technical support for the F-gas reporting process is provided by the EEA’s European Topic Centre on Climate Change Mitigation (ETC CM) ⁽⁶⁾.

1.4 Confidentiality

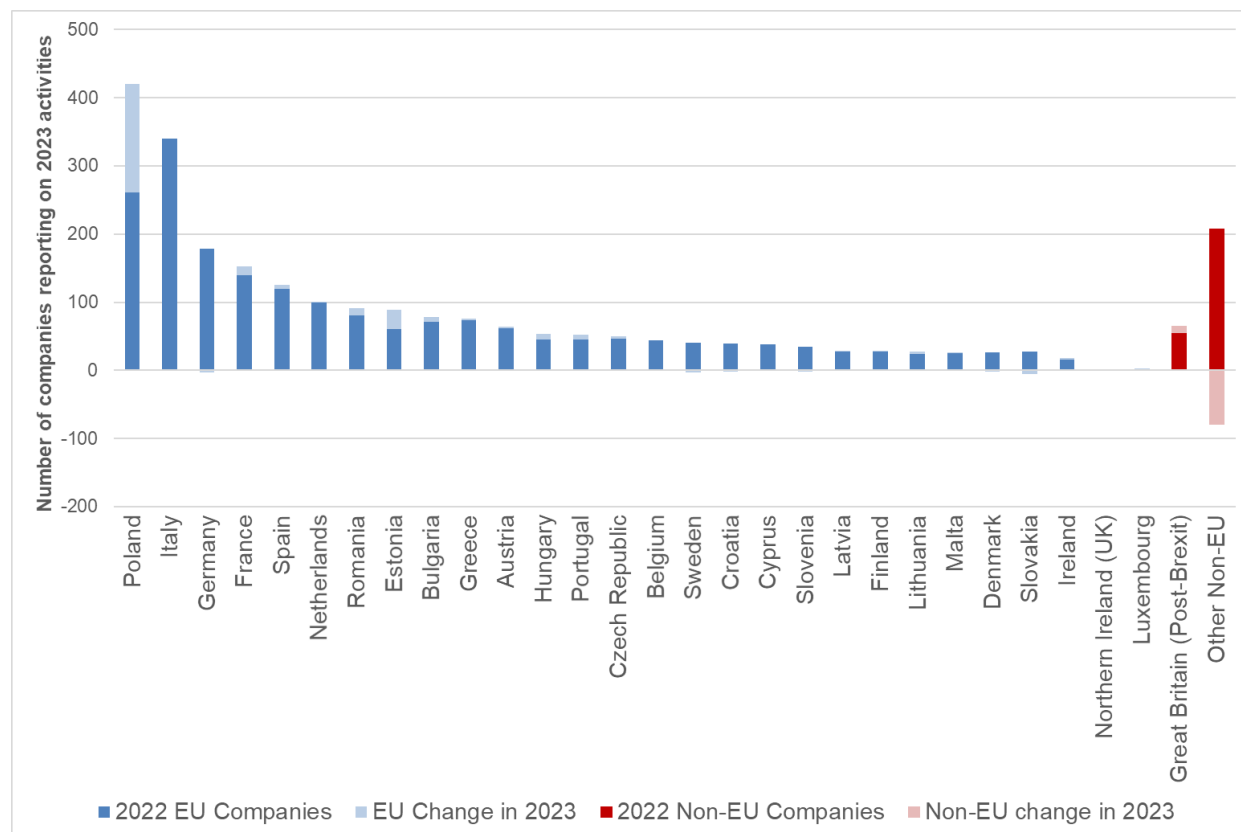

The F-gas Regulation requires that the confidentiality of the information submitted by companies is protected (Article 19(8)). The EEA takes appropriate measures to protect confidentiality and prevent publication of commercially sensitive information. These measures include public reporting of F-gases data only at higher levels of aggregation, to protect data that are the result of reports from fewer than three corporate groups, and additional steps to prevent deduction of sensitive information. It is for confidentiality reasons that some of the statements about F-gas activity in this report are of a general nature and do not refer to exact figures or percentages. A summary of the confidentiality measures applied to the data published in this report is included at the beginning of Section 7.

2 Figures on companies reporting in 2023

Figure 2-1 Reporting companies by Member State

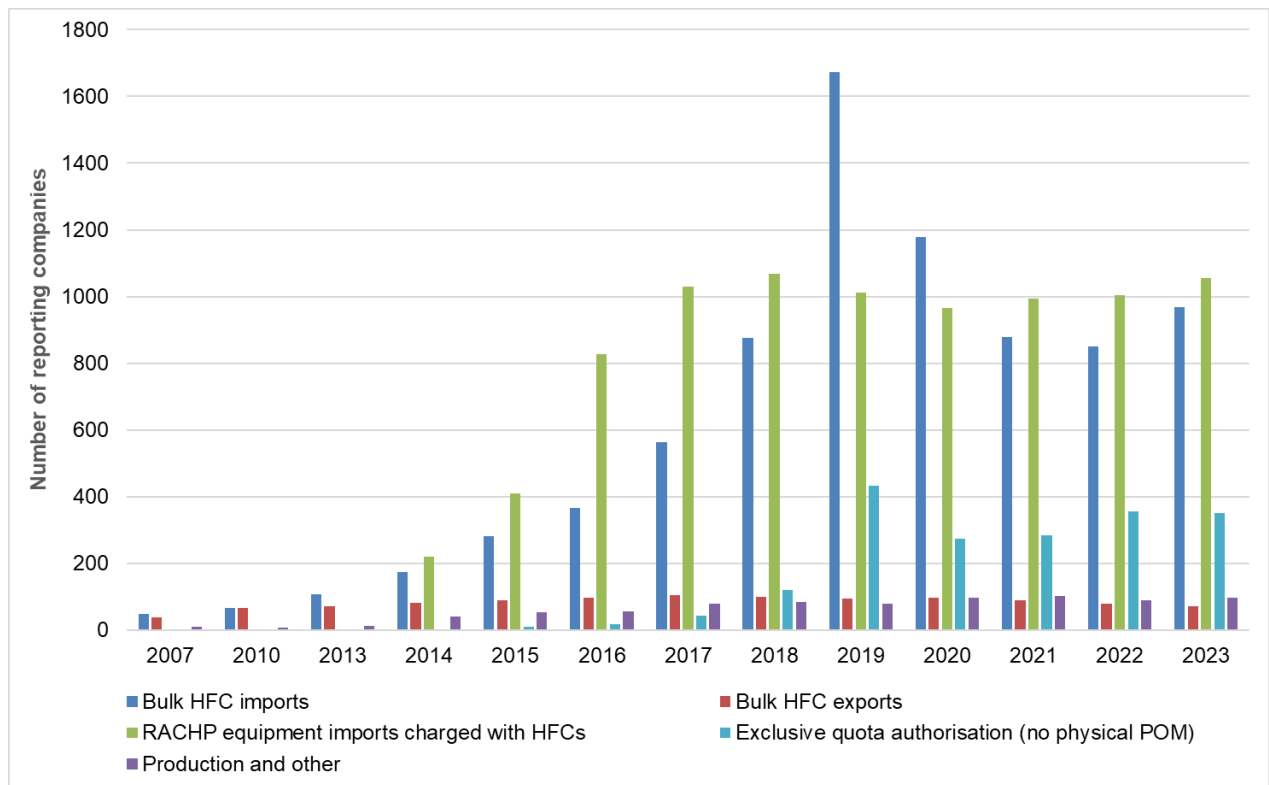

Note: Nil reports not included.

Other Non-EU countries: United Arab Emirates, Albania, Brazil, Switzerland, China, Hong Kong, India, Japan, Republic of Korea, Liechtenstein, Monaco, Marshall Islands, Malaysia, Norway, Serbia, Russian Federation, Turkey, United States, Great Britain (Post-Brexit).

Source: EEA, 2024b.

Table 23 in Section 7 (Data tables, page 69) presents a breakdown of reporting companies by countries and reported activities for 2023.

Figure 2-2 **Reported activities, 2007-2023**

Sources: EC, 2011 and 2014; EEA, 2023a and 2024b.

For a more detailed breakdown of reported activities over time, please refer to Table 25 in Section 7 (Data tables, page 71).

3 Figures on F-gas activity in the European Union

This chapter presents data reported by companies on:

- production and reclamation (Section 3.1);
- imports, both bulk and in products/equipment, and bulk exports (Section 3.2);
- destruction (Section 3.3).

3.1 Production and reclamation

‘Production’ refers to the production of virgin F-gases. The F-gas Regulation defines ‘reclamation’ as ‘the reprocessing of a recovered fluorinated greenhouse gas in order to match the equivalent performance of a virgin substance, taking into account its intended use’. Note that reclaimed HFCs do not count as ‘placed on the market’ and are not subject to the limits of the HFC phase-down.

Figure 3-1 EU production of fluorinated gases

Note: The geographical scope of presented data is the EU-28 except Croatia for 2007-2008, EU-28 for 2009-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. The scope of F-Gases in the data presented is determined by Regulation (EU) 517/2014. Annex II F-gases (unsaturated HFCs and HCFCs, HFEs and alcohols, and NF₃ and other perfluorinated compounds) were not subject to reporting for the years 2007-2013.

Sources: EC, 2011 and 2014; EEA, 2023a and 2024b.

A tabular overview on F-gases produced in the EU since 2007 in tonnes and CO₂e is given in Table 1 and Table 2 in section 7 (Data tables, page 46f.).

Figure 3-2 EU reclamation of fluorinated gases

Note: The geographical scope of presented data is the EU-28 except Croatia for 2007-2008, EU-28 for 2009-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. The scope of F-Gases in the data presented is determined by Regulation (EU) 517/2014. Annex II F-gases (unsaturated HFCs and HCFCs, HFEs and alcohols, and NF_3 and other perfluorinated compounds) were not subject to reporting for the years 2007-2013.

Sources: EC, 2011 and 2014; EEA, 2023a and 2024b.

3.2 Imports and exports

3.2.1 Imports

Detailed data on total imports can be found in Table 5 and Table 6 in section 7 (Data tables, page 50f.).

Figure 3-3 EU imports of fluorinated gases

Note: The geographical scope of presented data is EU-28 except Croatia for 2007-2008, EU-28 for 2009-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. The scope of F-Gases in the data presented is determined by Regulation (EU) 517/2014. Annex II F-gases (unsaturated HFCs and HCFCs, HFEs and alcohols, and NF_3 and other perfluorinated compounds) and HFCs, PFCs and SF_6 imported in products and equipment were not subject to reporting for the years 2007-2013. Data available for Croatia 2009-2012 is limited to HFCs and does not cover PFCs and SF_6 .

Sources: EC, 2011 and 2014; EEA, 2023a and 2024b.

Figure 3-4 EU imports by type

Note: The geographical scope of presented data is EU-28 except Croatia for 2007-2008, EU-28 for 2009-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. The scope of F-Gases in the data presented is determined by Regulation (EU) 517/2014. Annex II F-gases (unsaturated HFCs and HCFCs, HFEs and alcohols, and NF₃ and other perfluorinated compounds) and HFCs, PFCs and SF₆ imported in products and equipment were not subject to reporting for the years 2007-2013. Data available for Croatia 2009-2012 is limited to HFCs and does not cover PFCs and SF₆. Bulk imports under FGR definition starting 2014 do include imports of pre-blended polyols which are thus not included in the amounts shown for imports in products and equipment.

Sources: EC, 2011 and 2014; EEA, 2023a and 2024b.

3.2.2 Bulk Imports

Figure 3-5 Origin of bulk HFC imports (tonnes)

Note: The geographical scope of presented data is EU-28 for 2018-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. Bulk imports presented here are cleared of imports of pre-blended polyols and thus compatible with the MP definition.

Sources: EEA, 2023a and 2024b.

Figure 3-6 Origin of bulk HFC imports (GWP)

Note: The geographical scope of presented data is EU-28 for 2018-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. Bulk imports presented here are cleared of imports of pre-blended polyols and thus compatible with the MP definition.

Sources: EEA, 2023a and 2024b.

Detailed data on bulk F-gas imports is contained in [Table 7](#) and [Table 8](#) in section 7 (Data tables, page 52f.).

3.2.3 Imports contained in products and equipment

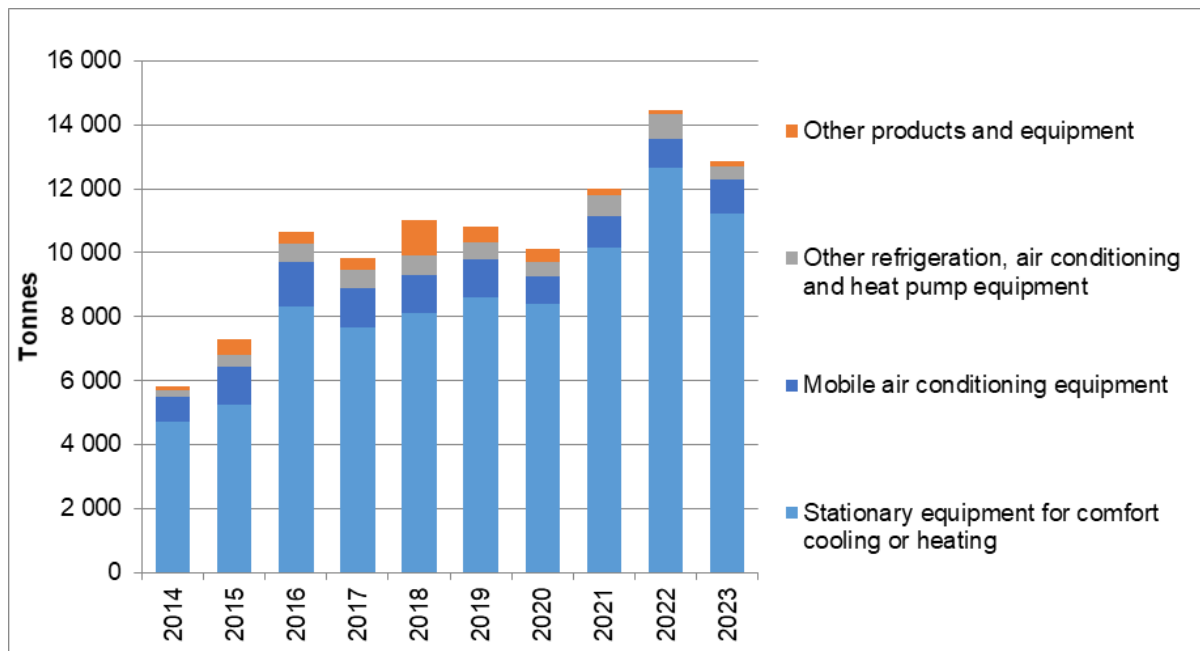

Figure 3-7 EU imports of fluorinated gases within products and equipment

Note: The geographical scope of presented data is EU-28 for 2014-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. Imports of pre-blended polyols are not included in the data shown.

Sources: EEA, 2023a and 2024b.

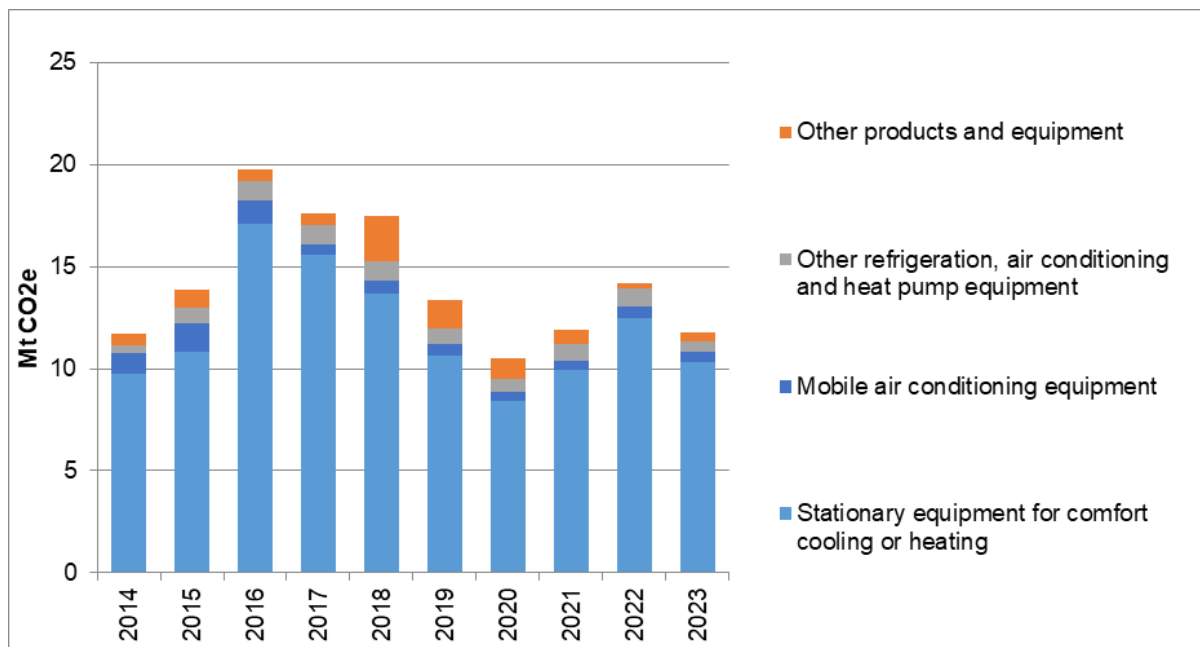

Figure 3-8 Categories of EU supply in products and equipment of fluorinated gases (tonnes)

Note: The geographical scope of presented data is EU-28 for 2014-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. Imports of pre-blended polyols are included since 2018.

Sources: EEA, 2023a and 2024b.

Figure 3-9 Categories of EU supply in products and equipment of fluorinated gases (CO₂e)

Note: The geographical scope of presented data is EU-28 for 2014-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. Imports of pre-blended polyols are included since 2018.

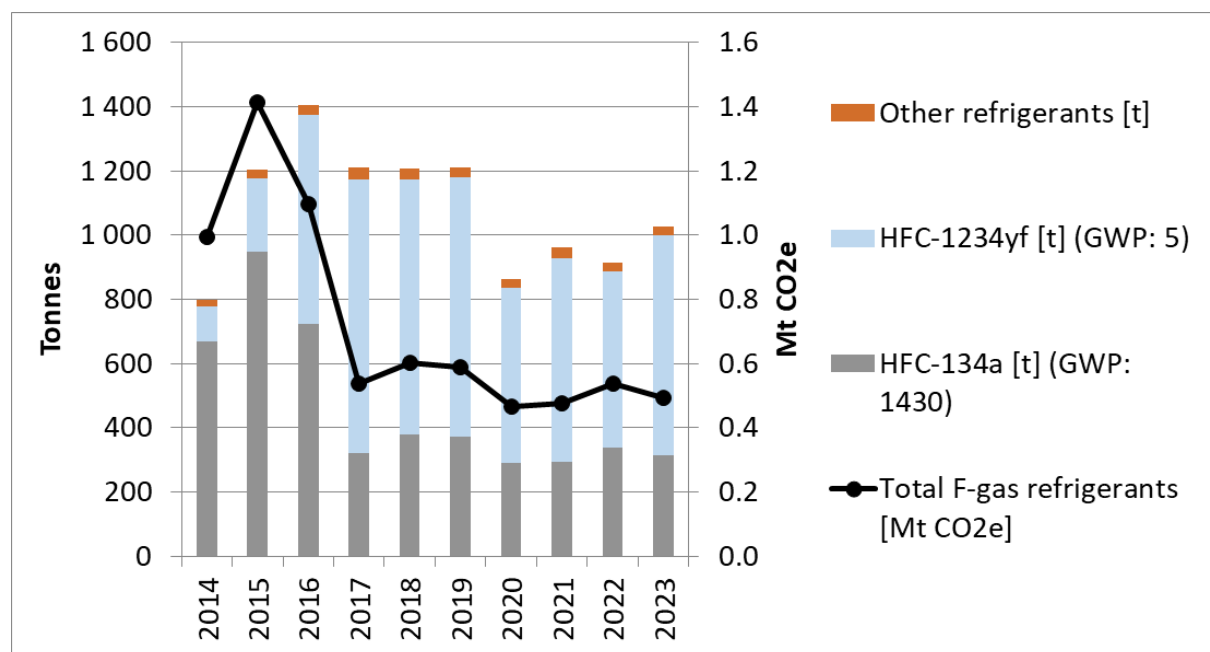

Figure 3-10 Refrigerants in imported stationary RACHP equipment

Note: The geographical scope of presented data is EU-28 for 2014-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years.

Sources: EEA, 2023a and 2024b.

Figure 3-11 EU imports of fluorinated gases within air conditioning equipment for vehicles

Note: The geographical scope of presented data is EU-28 for 2014-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years.

Sources: EEA, 2023a and 2024b.

Detailed data on F-gases in imported products and equipment are listed in Table 9 and Table 10 Table 10 in section 7 (Data tables, page 54f.). Equipment imports by equipment category are given in Table 11 and Table 12 (page 55f.).

3.2.4 Exports

Figure 3.12 EU bulk exports of fluorinated gases

Note: The geographical scope of presented data is EU-28 except Croatia for 2007-2008, EU-28 for 2009-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. The scope of F-Gases in the data presented is determined by Regulation (EU) 517/2014. Annex II F-gases (unsaturated HFCs and HCFCs, HFEs and alcohols, and NF_3 and other perfluorinated compounds) were not subject to reporting for the years 2007-2013. Bulk exports shown for 2014-2017 include gases exported in pre-blended polyols. Data available for Croatia 2009-2012 is limited to HFCs and does not cover PFCs and SF_6 .

Sources: EC, 2011 and 2014; EEA, 2023a and 2024b.

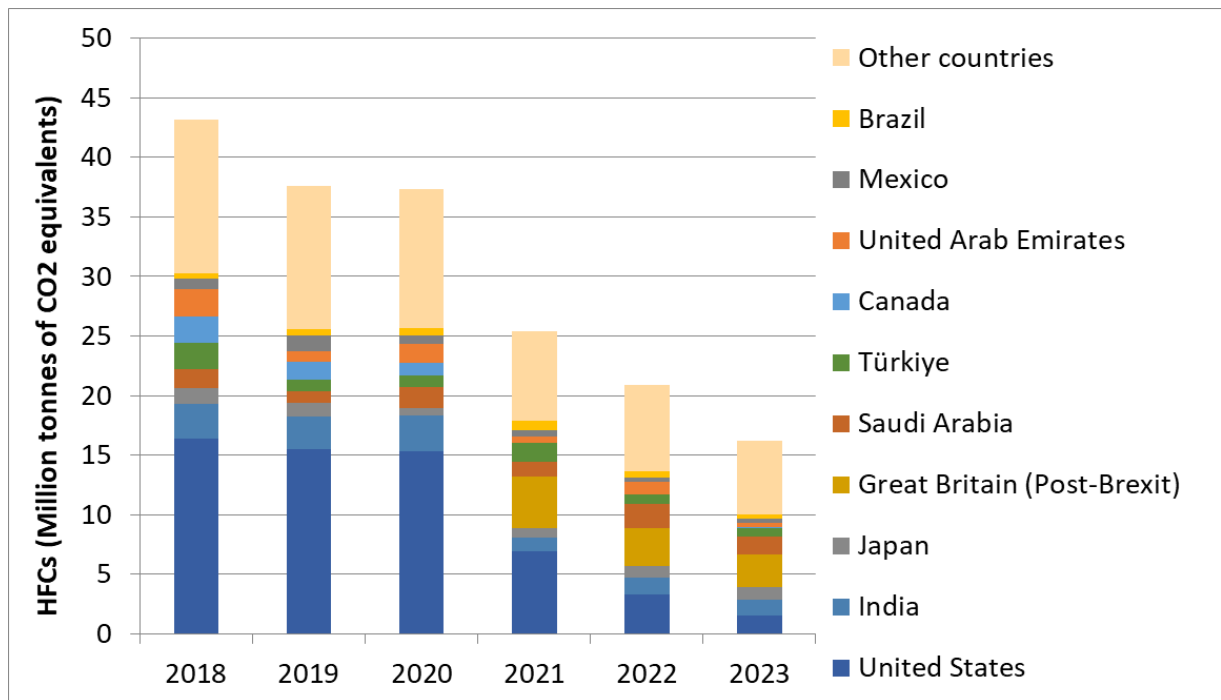

Figure 3-13 Destination of bulk HFC exports (tonnes)

Note: The geographical scope of presented data is EU-28 for 2018-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. Bulk imports presented here are cleared of imports of pre-blended polyols and thus compatible with the MP definition.

Sources: EEA, 2023a and 2024b.

Figure 3-14 Destination of bulk HFC exports (GWP)

Note: The geographical scope of presented data is EU-28 for 2018-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. Bulk imports presented here are cleared of imports of pre-blended polyols and thus compatible with the MP definition.

Sources: EEA, 2023a and 2024b.

Detailed data on exports can be found in in [Table 13](#) and [Table 14](#) in section 7 (Data tables, page 57f.).

3.3 Destruction of fluorinated gases

This section presents the amounts of F-gases reported as destroyed.

Figure 3-15 EU destruction of fluorinated gases

Note: The geographical scope of presented data is EU-28 except Croatia for 2007-2008, EU-28 for 2009-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. The scope of F-Gases in the data presented is determined by Regulation (EU) 517/2014. Annex II F-gases (unsaturated HFCs and HCFCs, HFEs and alcohols, and NF_3 and other perfluorinated compounds) were not subject to reporting for the years 2007-2013.

Sources: EC, 2011 and 2014; EEA, 2023a and 2024b.

4 Figures on the supply of fluorinated gases to the EU

Supply of fluorinated gases is a metric used by the EEA that provides information on the actual use of fluorinated gases by EU industries. It is calculated primarily from reported production, imports and exports ⁽⁷⁾.

4.1 Trends in the EU supply by gas

Figure 4-1 EU supply of fluorinated gases

Note: The geographical scope of presented data is EU-28 except Croatia for 2007-2008, EU-28 for 2009-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. The scope of F-Gases in the data presented is determined by Regulation (EU) 517/2014. Annex II F-gases (unsaturated HFCs and HCFCs, HFEs and alcohols, and NF_3 and other perfluorinated compounds) and HFCs, PFCs and SF_6 imported in products and equipment were not subject to reporting for the years 2007-2013. Data available for Croatia 2009-2012 is limited to HFCs and does not cover PFCs and SF_6 .

Sources: EC, 2011 and 2014; EEA, 2023a and 2024b.

⁽⁷⁾ For methodological details on the calculation of EU supply, please refer to section 10, which explains the difference between the metrics of 'EU supply', 'placing on the market', and 'consumption', which are relevant for different aspects of the legal framework.

Figure 4-2 EU supply of fluorinated gases by types

Note: The geographical scope of presented data is EU-28 except Croatia for 2007-2008, EU-28 for 2009-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. The scope of F-Gases in the data presented is determined by Regulation (EU) 517/2014. Annex II F-gases (unsaturated HFCs and HCFCs, HFEs and alcohols, and NF₃ and other perfluorinated compounds) and HFCs, PFCs and SF₆ imported in products and equipment were not subject to reporting for the years 2007-2013. Data available for Croatia 2009-2012 is limited to HFCs and does not cover PFCs and SF₆. Imports of pre-blended polyols, available since 2018, were assigned to the supply in products and equipment.

Figure 4-8 Intended applications of EU total supply of fluorinated gases (CO₂e)

Note: The geographical scope of presented data is EU-28 except Croatia for 2007-2008, EU-28 for 2009-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. The scope of F-Gases in the data presented is determined by Regulation (EU) 517/2014. Annex II F-gases (unsaturated HFCs and HCFCs, HFEs and alcohols, and NF₃ and other perfluorinated compounds) and HFCs, PFCs and SF₆ imported in products and equipment were not subject to reporting for the years 2007-2013. Data available for Croatia 2009-2012 is limited to HFCs and does not cover PFCs and SF₆.

Sources: EC, 2011 and 2014; EEA, 2023a and 2024b.

Detailed data on intended applications can be found in Table 19 and Table 20 in section 7 (page 65f). For categories of supply in products and equipment, please refer to Table 11 and Table 12 (page 55f). For details of the calculation methods, please refer to section 10.

5 Figures on the progress of the EU HFC phase-down

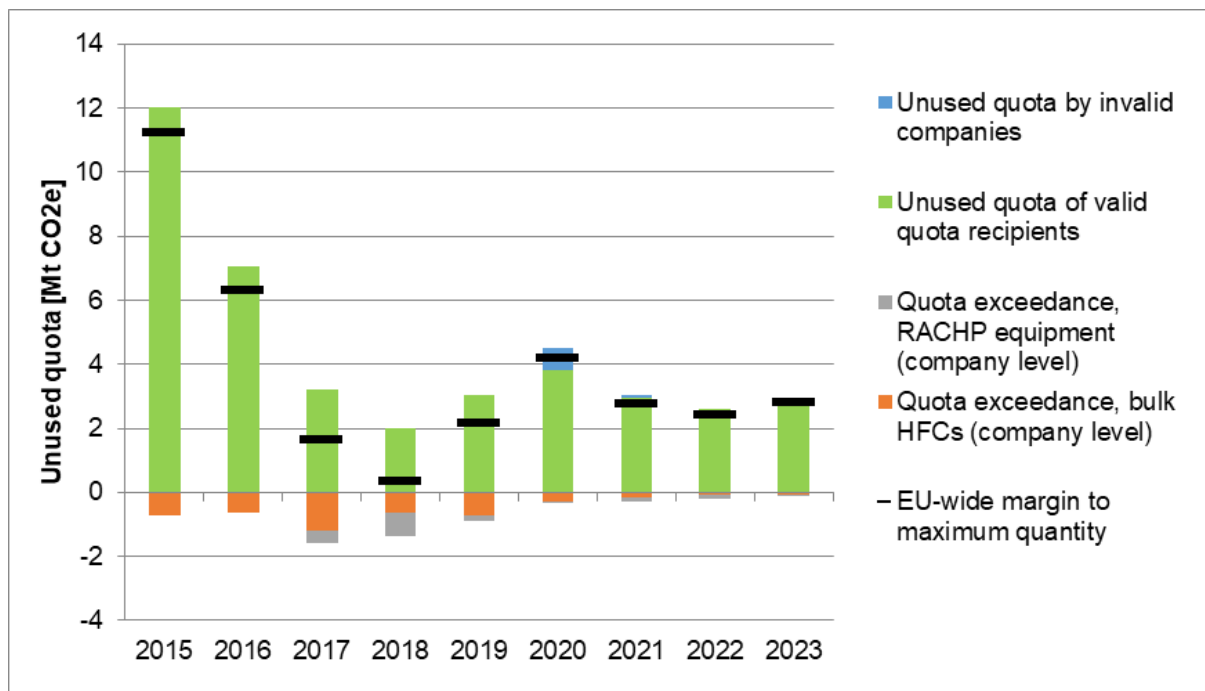

Figure 5-1 Progress of the EU HFC phase-down

Notes: POM, placing on the market. Values from 2007 to 2013 are based on the reporting obligations of the previous F-gas Regulation (EC) No 842/2006 and are therefore not fully comparable with data from 2014 onwards (based on the obligations of the revised F-gas Regulation (EU) No 517/2014). The geographical scope of presented POM data is EU-28 except Croatia for 2007-2008, EU-28 for 2009-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. The maximum quantities of the EU HFC phase-down shown for 2015-2019 are given for the EU-28, the maximum quantity for 2020 applies to the EU-27 and the United Kingdom. Maximum quantities for 2021 onwards are given for the EU-27.

Sources: EC, 2011, 2014 and 2020; EEA, 2023a and 2024b.

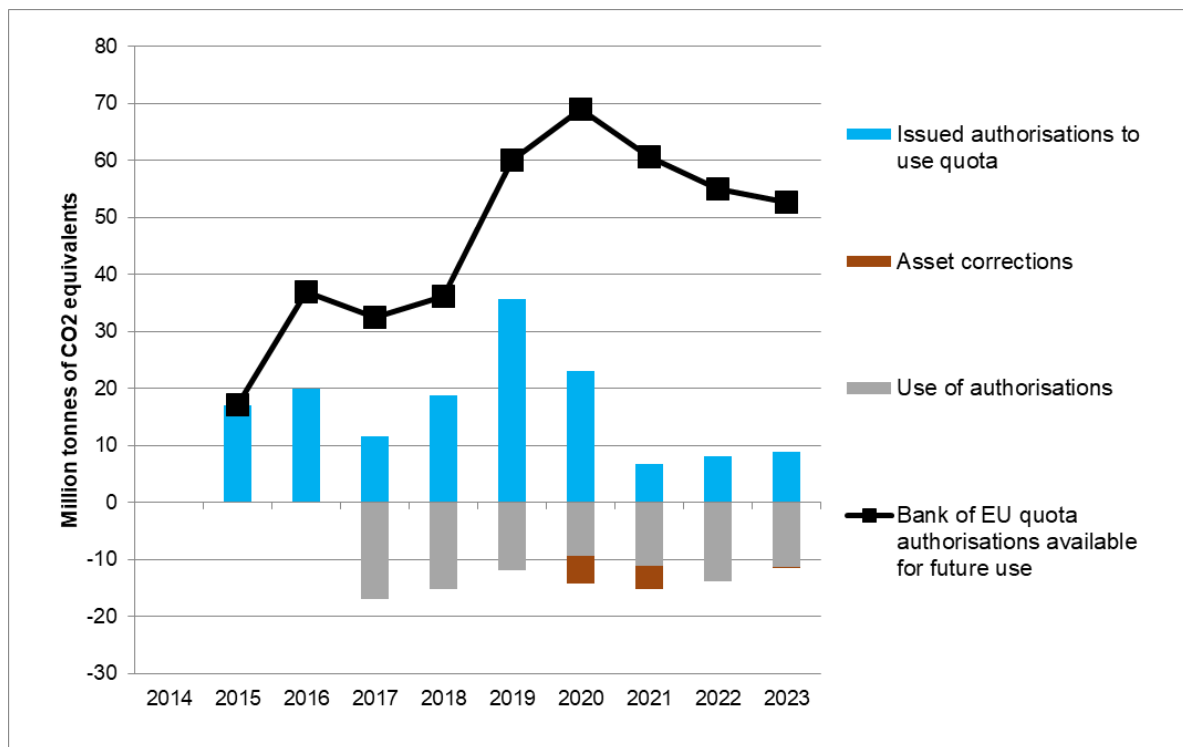

Figure 5-2 Balance between placing on the market of HFCs and related quotas at EU level

Note: Scrutiny by the European Commission is not yet finalized for 2023 data. The geographical scope of presented data is EU-28 for 2015-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years.

Sources: EC, 2023; EEA, 2023a and 2024b.

Figure 5-3 Bank of authorisations for HFCs in RACHP equipment imports

Notes: RACHP: refrigeration, air conditioning and heat pumps. The geographical scope of presented data is EU-28 for 2015-2019, EU-27+UK for 2020, and EU-27 for 2021 and subsequent years. 2020 and 2021 asset corrections due to Brexit.

Sources: EC, 2023 and EEA, 2023b.

A tabular overview data related to the progress of the HFC phase-down under the FGR is given in Table 21 in section 7 (Data tables, page 67).

6 Figures on the international HFC phase-down under the Montreal Protocol

Figure 6-1 EU progress under the Montreal Protocol HFC phase-down

Notes: MP, Montreal Protocol. HFCs covered under the Montreal Protocol include all HFCs covered under EU F-gas Regulation No 517/2014, except HFC-161 (see 9). The geographical scope of presented HFC consumption data EU-28 except Croatia for 2007-2008, EU-28 for 2009-2019, EU-27+UK for 2020 and EU-27 from 2021 and subsequent years.

The HFC consumption limit is shown for EU-27+UK for 2019 and 2020 and for EU-27 from 2021 and subsequent years.

Sources: EC, 2011, and 2014; EEA, 2023a and 2024b.

A tabular overview of HFC consumption is given in Table 22 section 7 (Data tables, page 68).

7 Data tables

7.1 Measures to protect confidential data

The EEA takes appropriate steps to protect the confidentiality of commercially sensitive information in accordance with Article 19 (8) of F-gas Regulation 517/2014. Throughout the report, three rules are applied to all numbers and figures to determine whether a data item must remain confidential.

Three-company group rule. This rule stipulates that any value that is published must be the sum of at least three different companies. In addition, companies are invited to specify affiliates in their report. These groups of affiliates, if mutually confirmed, count as one company for the purpose of this evaluation.

5% significance rule. The contributions of small companies to any value may be insignificant, and larger companies' confidentiality may be compromised despite the first rule. Therefore, a value remains confidential if fewer than three companies make up more than 95% of the total, discounting the smallest contributors that make up 5% of the sum.

Preventing deduction. Deduction might be possible where a confidential value is part of a sum of substances or transactions. For example, a confidential value for sulphur hexafluoride (SF₆) may be deduced if there are figures published for perfluorocarbons (PFCs) as well as a total for SF₆ and PFCs. In the case of metrics such as 'supply', a confidential value, e.g. for 'production', may be deduced if values for both 'import' and 'export' are known and the remainder of small transactions that make up 'supply' is very small. Therefore, two steps are taken:

- In cases where a sum across substances or transactions is published, and there is only one value contributing to that sum that is confidential according to the above rules, a second part of the sum is made confidential to make sure that the lone confidential value cannot be deduced from the sum and remaining parts.

In the case of supply metrics, a second of the major contributors (production, import and export) is made confidential if one of them is confidential according to the above rules and the remainder of small transactions makes up less than 5% of the total.

A practical guide to applying the 'three-company group rule' and '5% significance rule' measures to data

Operationalisation of the combined three-company group rule and 5% significance rule

Step 1: all values reported by companies of a given company group for a given transaction year were added up for a given transaction and substance or substance group.

$$\sum X_i = X_1 + X_2 + \dots + X_n$$

X_i = individual reported value by a single reporting undertaking

$\sum X_i$ = sum of individual reported values by reporting undertakings
belonging to the same company group

Step 2: the sum of all absolute contributions ($\sum |\sum X_i|$) across company groups was calculated.

Step 3: the percentage of step 1 in relation to step 2 was calculated for each company group.

$$\% = \frac{|\sum X_i|}{\sum |\sum X_i|} \cdot 100$$

Step 4: the company groups were sorted in ascending order of the percentages calculated in step 3.

Step 5: an accumulated percentage was calculated across the sorted company groups.

Step 6: the number of company groups for which the accumulated percentage was larger than 5% was counted.

If the number of company groups counted in step 6 was one or two, the full aggregated value across company groups was hidden as confidential. If the number was three or more, the full aggregated value across company groups was reported and was thus not confidential.

8 Terminology

Fluorinated gases (F-gases)

F-gases covered by this report can be grouped into:

- gases contained in Annex I of the new F-gas Regulation, as listed in Table 26 in Section 9 of this report;
- gases contained in Annex II of the new F-gas Regulation, as listed in Table 27 in Section 9 of this report.

Jointly, those gases are referred to in this report as 'fluorinated gases' or 'F-gases'.

The list of reportable fluorinated gases under the old F-gas Regulation was restricted to HFCs, PFCs and SF₆, as identified in section 9 on page 74.

Annex I F-gases

F-gases under Annex I of the new F-gas Regulation include HFCs, PFCs and SF₆. The majority of these gases have high GWPs.

The gases of Annex I of the new F-gas Regulation are given in section 9 of this annex.

Hydrofluorocarbons (HFCs)

HFCs are relatively short aliphatic organic compounds that contain fluorine, carbon and hydrogen. They are most commonly used as refrigerants. Nineteen HFCs and their GWPs are listed in Annex 1. All HFCs in Annex 1, except HFC-152 and HFC-161, were previously covered by the old F-gas Regulation (EC) No 842/2006. Any mixture (blend) that includes at least one HFC is considered an HFC under the F-gas Regulation and therefore is covered by the quota system. The GWP of such a mixture is calculated according to Annex IV of the F-gas Regulation.

Perfluorocarbons (PFCs)

PFCs are relatively short aliphatic organic compounds that contain fluorine and carbon only. They are most commonly used in semiconductor manufacture. Seven PFCs and their GWPs are listed in Annex 1. All PFCs in Annex 1 were previously covered by the old F-gas Regulation.

Sulphur hexafluoride (SF₆)

SF₆ is an inorganic compound; because it is an excellent electrical insulator, its main use is in the electrical industry. SF₆ is a potent greenhouse gas; its GWP is listed in Annex 1. SF₆ was also covered by the old F-gas Regulation.

Annex II F-gases

'Other fluorinated greenhouse gases' are listed in Annex II of Regulation No 517/2014 and include:

- unsaturated hydro(chloro)fluorocarbons (Section 1 of Annex II);
- fluorinated ethers and alcohols (Section 2 of Annex II);
- other perfluorinated compounds, including NF₃ (Section 3 of Annex II).

All these gases and their GWPs are listed in section 9 of this annex. The Annex II F-gases were not covered by the reporting obligations under the old F-gas Regulation (EC) No 842/2006.

Bulk gases and gases contained in equipment

Gases contained in gas containers, including bottles and isotanks, are referred to as bulk gases, irrespective of the absolute amounts of gases handled. Bulk gases are to be differentiated from gases contained in products or equipment, as different reporting obligations apply.

Mixtures

Mixtures of fluorinated gases are often used in industrial applications. In their reports under Article 19 of the F-gas Regulation (EU) No 517/2014, companies report on their transactions (import, export, etc.) of such mixtures, while specifying their composition. For the purpose of the present aggregation report, the amounts of mixtures are recalculated as the proportions of their constituent fluorinated gases as listed in section 9, unless indicated otherwise.

Annex IV gases

Annex IV of the new F-gas Regulation lists some non-fluorinated greenhouse gases that have GWPs that also need to be considered when determining the GWP of a mixture. These gases and their GWPs are also listed in section 9 of this annex (Table 28). For all other substances included in a mixture, a default value of 0 is used for the calculation the GWP.

Nil report

A nil report is a notification by a company that it considers itself not obliged to report under the F-gas Regulation.

Global warming potentials (GWPs)

GWPs are used to make different gases comparable in terms of their potential impact on climate change. The multiplication of a quantity of a gas by its GWP results in that quantity expressed as CO₂e.

The GWPs used under the new F-gas Regulation are in line with those published in the Intergovernmental Panel on Climate Change (IPCC) Fourth Assessment Report (AR4) (IPCC, 2007). The old F-gas Regulation (EC) No 842/2006 used the earlier set of GWPs published by the IPCC in its Third Assessment Report (TAR) (IPCC, 2001). Accordingly, previous EEA technical reports on fluorinated gases up to 2014 used TAR GWPs.

Quantities of F-gases are reported in physical tonnes. Conversion of the figures into CO₂e based on gas-specific GWPs facilitates a focus on the potential warming effect caused by these gases after release to the atmosphere. Both metrics are used in this report when analysing the data.

The GWPs of gases used for the present report are listed in section 9. GWPs of mixtures are calculated according to Annex IV of the F-gas regulation (EU, 2014).

9 Gases covered by Regulation (EU) No 517/2014

On 11 March 2024, the new F-Gas Regulation (EU) 2024/573 started to apply. However, the data collection presented in this report, which is based on reports in spring 2024 by companies on their transactions in 2023, was still subject under the old F-Gas Regulation (EU) 517/2014.

Table 28 Non-fluorinated gases in Annex IV of Regulation (EU) No 517/2014 (not covered by the previous Regulation (EC) No 842/2006)

According to Annex IV of the new F-gas Regulation (EU) No 517/2014, the GWP of mixtures containing gases outside the scope of Annexes I and II of Regulation (EU) No 517/2014 are to be calculated using the GWPs given here for the non-fluorinated gases. For other constituents of mixtures that are not listed here (e.g. ODS), a GWP value of zero shall be used.

Substance	Formula	GWP (AR4)
R-170 (Ethane)	CH ₃ CH ₃	6
R-290 (Propane)	CH ₃ CH ₂ CH ₃	3
R-600 (Butane)	CH ₃ CH ₂ CH ₂ CH ₃	4
R-600A (Isobutane)	CH(CH ₃) ₂ CH ₃	3
R-601 (Pentane)	CH ₃ CH ₂ CH ₂ CH ₂ CH ₃	5
R-601A (Isopentane)	(CH ₃) ₂ CHCH ₂ CH ₃	5
C ₅ H ₁₀ (Cyclopentane)	C ₅ H ₁₀	5
R-610 (Ethoxyethane, diethyl ether)	CH ₃ CH ₂ OCH ₂ CH ₃	4

10 Calculation methods

This section provides documentation for:

- Calculation of EU imports (page 78)
- Calculation of EU exports (page 78)
- Calculation of EU supply (page 78); Calculation of HFC amounts placed on the market (POM) under the EU HFC phase-down (page 79) and
- Calculation of HFC consumption under the international HFC phase-down under the Montreal Protocol (page 80).

Table 30 (page 84) provides a summary comparison between the three metrics supply, POM, and consumption.

Calculation of EU imports

HFC imports reported from intermediate storage under customs warehousing after inward processing are not considered for the EU imports statistics. This data is available since 2018. However such data is relevant for the calculation of amounts placed on the market (POM).

Calculation of EU exports

HFC exports reported to intermediate storage under customs warehousing after inward processing are not considered for the EU exports statistics. This data is available since 2018. However such data is relevant for the calculation of amounts placed on the market (POM).

Data reported for the export of pre-blended polyols, available since 2018, is not considered for the EU statistics on bulk exports.

Calculation of EU supply

Total supply (TS)

‘EU total supply’ is a parameter that provides information on the actual use of fluorinated gases by EU industries. Notably, TS also includes gases that are contained in exported products and equipment. In the logic of the supply metrics used in this report, such gases count towards the gas demand of EU industries. ‘EU total supply’ is the sum of ‘EU bulk supply’ and ‘EU supply in products/equipment’. It is comparable to the net supply metric used in earlier EEA reports on F-gases.

Bulk supply (BS)

The ‘bulk supply’ metric is focused on emission-relevant supplies of bulk gases to EU industries and therefore does not cover EU supplies intended for feedstock or destruction. Starting in 2014, BS has been defined as:

Bulk supply (BS) = production (1A) – destroyed (captured) production (1D) + full imports (2A) – full exports (3A) + 1 January stocks from own import/production (4B) – 31 December stocks from own import/production (4G) + reclamation (4K) – POM intended for destruction (6B) – feedstock use (7A).

Since 2018, the new reporting items on imports (2A_pp) and exports (3A_pp) of pre-blended polyols are considered: Imports of pre-blended are subtracted and exports of pre-blended polyols are added in the equation for BS.

Since 2019, the explicit inclusion of non-captured production in the reporting scheme was reflected in order to exclude the emissions of non-captured production from supply: non-captured production

totals (1Aa) are subtracted and amounts of non-captured production used as feedstock (1A_fs1) are added in the equation for BS. Furthermore, imports from and exports into EU intermediate storage under customs warehousing after inward processing were excluded from the BS calculation (those amounts are also excluded from the data shown in this report for imports and exports, respectively).

For the years 2007-2013, bulk supply (BS) is calculated as follows:

BS = Production + Imports – Exports + Stocks 1 January – Stocks 31 December + Reclamation – own feedstock use – intended application: feedstock.

EU supply in products/equipment

The 'EU supply in products/equipment' (SPE) metric covers the amount of fluorinated gases that are imported into the EU within products or equipment and placed on the market. Exports of F-gases within products and equipment are not reported under the new F-gas Regulation (No 517/2014) or subtracted for the SPE metric. Thus, the SPE metric covers only imports and it is not intended to cover the net flows of F-gases within products or equipment across EU borders.

SPE is calculated as the sum of all gases reported in Section 11 of the reporting questionnaire. Since 2018, the new reporting item on imports of pre-blended polyols (2A_pp) is added. No data on SPE were collected before 2014.

Intended applications of bulk or total supply

In Section 6 of the reporting questionnaire, companies report on the intended applications of bulk gases supplied to the EU market (6X). This metric differs from bulk supply in the way it accounts for re-exports, amounts intended for destruction and feedstock. It is calculated as follows:

$6X = (\text{net}) \text{ production } (1E = 1A - 1D) + \text{full imports } (2A) - \text{re-exports within products of own bulk imports } (2B) - \text{bulk re-exports of own imports } (3B) + 1 \text{ January stocks from own import/production } (4B) - 31 \text{ December stocks from own import/production } (4G) + \text{reclamation } (4K).$

To estimate the intended applications of EU bulk or total supply, a five-step process is used:

- 1 Per gas, determine the proportion of each reported application in a subset of categories without export (6A), destruction (6B), leakage (6U) and accountancy adjustments (6V).
- 2 Assume leakage and accountancy adjustments in bulk or total supply to be equal to the amounts reported in Section 6 and subtract those from total bulk or total supply.
- 3 Apply the proportions determined in step 1 to the remainder of bulk or total supply.
- 4 Assign any remainder to the category 'Other or unknown applications' (6T).
- 5 Assign all net exports of pre-blended polyols (3A_pp-2A_pp) to the intended application 6G (pre-blended polyols).

Calculation of HFC amounts placed on the market (POM) under the EU HFC phase-down

The quota of relevant POM starting in 2015 is calculated as:

Bulk HFCs physically placed on the market (4M), converted into CO₂e

minus

Exemptions under Article 15(2) (5A + (5B) + 5C_exempted + 5D + 5E), converted into CO₂e (5F is included in the exemptions from 2017)

plus

Issued authorisations (9A).

For years where the POM compliance exercise by DG CLIMA has been completed, The POM amounts given are based on the POM established in the HFC registry.

Bulk HFC POM 2007-2013 is calculated per year and per company based on data reported under the old F-gas Regulation as:

HFC production, converted into CO₂e
plus
HFC imports, converted into CO₂e
minus
HFC exports, converted into CO₂e
plus
1 January HFC stocks, converted into CO₂e
minus
31 December HFC stocks, converted into CO₂e
minus
HFCs used for feedstock, converted into CO₂e
minus
HFC supplies intended for feedstock use, converted into CO₂e.

Where the amount thus calculated is negative for a given company in a given year, the POM is set to zero before calculating the EU total as the sum of all companies.

Calculation of HFC consumption under the international HFC phase-down under the Montreal Protocol

The HFCs considered under the Montreal Protocol are all HFCs as listed in Annex I, Section 1 of the new F-gas Regulation No 517/2014 (see 9, page 74), except HFC-161.

HFC consumption starting in 2019 is calculated as follows:

Starting 2019, HFC consumption under the MP is calculated separately for HFC-23 (Annex F, Group II under the MP) and all other HFCs (Group I) covered by the MP:

For Group I HFCs, the calculation approach as depicted below for 2018 is continued with the additional element that imports from and exports to dependent overseas territories are not considered. A list of dependent territories is given in Table 29 (page 83). However, for the calculation of HFC consumption starting 2021, marking the end of the Brexit transition period, trade with UK overseas territories was considered for EU consumption.

For Group II HFCs / HFC-23, generated amounts not captured are not taken into account. In addition to the calculation scheme for Group I HFCs, the following data is thus subtracted/added:

minus
uncaptured HFC production (1Aa), converted into CO₂e
plus
destroyed uncaptured HFC production (1A_a), converted into CO₂e
plus
uncaptured HFC production used as feedstock (1A_fs1), converted into CO₂e

HFC consumption in 2018 is calculated as follows:

HFC production (1A), converted into CO₂e
minus
HFC production for feedstock use within the Union (1A_fs), converted into CO₂e
minus
HFC production for other uses exempted under the Montreal Protocol (1A_ex), converted into CO₂e
(1A_ex is not yet applicable as no exemptions have been agreed upon under the Montreal Protocol
so far)
plus
HFC imports (2A), converted into CO₂e
minus
HFC imports of pre-blended polyols (2A_pp), converted into CO₂e
minus
imports of used, recycled or reclaimed HFCs (2C), converted into CO₂e
minus
virgin HFC imports for feedstock use (2D), converted into CO₂e
minus
virgin HFC imports exempted under the Montreal Protocol (2E), converted into CO₂e
(2E is not yet applicable as no exemptions have been agreed so far under the Montreal Protocol)
minus
HFC exports (3A), converted into CO₂e
plus
HFC exports of pre-blended polyols (3A_pp), converted into CO₂e
plus
exports of used, recycled or reclaimed HFCs (3G), converted into CO₂e
plus
virgin HFC exports for feedstock use (3H), converted into CO₂e
plus
virgin HFC exports exempted under the Montreal Protocol (3I), converted into CO₂e
(3I is not yet applicable as no exemptions have been agreed so far under the Montreal Protocol)
minus
Total HFC destruction (8D), converted into CO₂e.

Imports reported from and exports reported to intermediate storage under customs warehousing
after inward processing are not considered as imports or exports for the purpose of consumption
under the MP.

HFC consumption starting in 2014 - 2017 is calculated as follows:

HFC production (1A), converted into CO₂e
plus
HFC imports (2A), converted into CO₂e
minus
HFC exports (3A), converted into CO₂e
plus

HFC exports for recycling (3D), converted into CO₂e
plus
HFC exports for reclamation (3E), converted into CO₂e
plus
HFC exports for destruction (3F), converted into CO₂e
minus
HFC feedstock use (7A), converted into CO₂e
minus
Total HFC destruction (8D), converted into CO₂e.

HFC consumption until 2013 is calculated from data reported under the old F-gas Regulation as follows:

HFC production, converted into CO₂e
plus
HFC imports, converted into CO₂e
minus
HFC exports, converted into CO₂e
plus
HFC exports for recycling, reclamation or destruction, converted into CO₂e
minus
Reporting companies' own HFC destruction, converted into CO₂e
minus
HFC amounts supplied by reporting companies to third parties for destruction, converted into CO₂e
minus
HFCs used for feedstock, converted into CO₂e
minus
HFC supplies intended for feedstock use, converted into CO₂e

Table 29 Dependent overseas territories of the EU-27 and the United Kingdom

Territory	MS Dependency relation
Anguilla	UK
Aruba	NL
Bermuda	UK
Bonaire, Sint Eustatius and Saba	NL
British Indian Ocean Territory	UK
Cayman Islands	UK
Curaçao	NL
Falkland Islands (Malvinas)	UK
Faroe Islands	DK
French Polynesia	FR
French Southern Territories	FR
Gibraltar	UK
Greenland	DK
Guernsey	UK
Isle of Man	UK
Jersey	UK
Montserrat	UK
New Caledonia	FR
Pitcairn	UK
Saint Barthélemy	FR
Saint Helena, Ascension and Tristan da Cunha	UK
Saint Pierre and Miquelon	FR
Sint Maarten (Dutch part)	NL
South Georgia and the South Sandwich Islands	UK
Turks and Caicos Islands	UK
Virgin Islands, British	UK
Wallis and Futuna	FR

Note: Dependent overseas territories of the United Kingdom were considered for the calculation of HFC consumption of the EU for the years until 2019, and for joint EU-27 and UK consumption in the year 2020.

Comparison of supply, POM and consumption metrics

Table 30 Scope of supply, POM, and consumption metrics

		Supply	Placing on the market (POM), relevant for compliance with the EU HFC phase-down	Consumption, relevant for compliance with the MP HFC phase-down	
		<i>covered gases</i>	<i>applicable to total F-gases and single gases/gas groups (e.g. HFCs)</i>	<i>HFCs of Annex I of EU F-gas Regulation 517/2014, including HFC shares and non-HFC shares of HFC-containing mixtures</i>	
		<i>units used</i>	<i>both physical tonnes and t CO₂e (GWP: AR4)</i>	<i>t CO₂e (GWP: AR4)</i>	
Transactions covered	Type of contribution				
Production	captured amounts	plus	yes	yes	yes
	Uncaptured amounts	plus	yes	yes	no
	Emissions of uncaptured amounts	minus	yes	no	not applicable
Reclamation		plus	yes	no	no
Recycling		plus	no	no	no
Bulk imports	from EU intermediate storage under customs warehousing after inward processing	plus	no	yes	no
	from dependent overseas territories	plus	yes	yes	no
	from other origins	plus	yes	yes	yes (except import of recycled and used bulk HFCs)
Imports in products and equipment	Pre-blended polyols	plus	yes	yes	no
	Refrigeration, air conditioning and heat pump (RACHP) equipment	plus	yes	2015-2016: no starting 2017, only amounts not covered by quota authorisations	no
	other products and equipment	plus	yes	no	no

		Supply	Placing on the market (POM), relevant for compliance with the EU HFC phase-down	Consumption, relevant for compliance with the MP HFC phase-down	
	<i>covered gases</i>	<i>applicable to total F-gases and single gases/gas groups (e.g. HFCs)</i>	<i>HFCs of Annex I of EU F-gas Regulation 517/2014, including HFC shares and non-HFC shares of HFC-containing mixtures</i>	<i>HFCs of Annex I of EU F-gas Regulation 517/2014 except HFC-161, including HFC shares of HFC-containing mixtures</i>	
	<i>units used</i>	<i>both physical tonnes and t CO₂e (GWP: AR4)</i>	<i>t CO₂e (GWP: AR4)</i>	<i>t CO₂e (GWP: AR4)</i>	
Transactions covered	Type of contribution				
Bulk exports	into EU intermediate storage under customs warehousing after inward processing	minus	no	exports from own production and exports from own imports are subtracted. Other bulk exports subtracted if directly supplied by the importer/producer to the exporter (exemption Art. 15(2)c)	no
	to dependent overseas territories	minus	yes		no
	to other destinations	minus	yes		yes (except export of recycled and used bulk HFCs)
exports in products and equipment	Pre-blended polyols	minus	no	yes	no
	other products and equipment	minus	no	subtracted in case the contained gases had never been placed on the market after bulk import (re-export, reported in section 2B)	no
Destruction	of EU production, destroyed before placing on the market and imports for destruction	minus	yes	yes (exemption Art. 15(2)a)	yes
	of used gases recovered within the EU	minus	no	no	yes
Feedstock use		minus	yes	yes (exemption Art. 15(2)b)	yes (HFC production for feedstock use in the Union and HFC import for feedstock use)
Supplies to military uses		minus	no	yes (exemption Art. 15(2)d)	no
Supplies to semiconductor industry		minus	no	yes (exemption Art. 15(2)e)	no

		Supply	Placing on the market (POM), relevant for compliance with the EU HFC phase-down	Consumption, relevant for compliance with the MP HFC phase-down
	<i>covered gases</i>	<i>applicable to total F-gases and single gases/gas groups (e.g. HFCs)</i>	<i>HFCs of Annex I of EU F-gas Regulation 517/2014, including HFC shares and non-HFC shares of HFC-containing mixtures</i>	<i>HFCs of Annex I of EU F-gas Regulation 517/2014 except HFC-161, including HFC shares of HFC-containing mixtures</i>
	<i>units used</i>	<i>both physical tonnes and t CO_{2e} (GWP: AR4)</i>	<i>t CO_{2e} (GWP: AR4)</i>	<i>t CO_{2e} (GWP: AR4)</i>
Transactions covered	Type of contribution			
Supplies to pharmaceutical MDIs	minus	no	not considered 2015-2017, considered 2018 onwards (exemption Art. 15(2)f)	no
1 January stocks	plus	full EU-based stocks from own production or own import considered, stocks under customs warehousing not considered, stocks from EU purchases not considered	only those EU-based stocks from own production or own import considered that have not yet been placed on the market, stocks under customs warehousing not considered, stocks from EU purchases and stocks from own imports/own production already placed on the market not considered	no
31 December stocks	minus			
HFC quota authorisations issued by producers/importers	plus	no	yes	no
